

WHAT IS CLAIMED IS:Sub
a1

1. A security and surveillance system, comprising:
a detector for determining a presence in a zone of
surveillance, said detector generating an activation signal
in response to said presence; and

a processor for generating an infrared code to perform
a specific function in response to said activation signal
from said detector.

2. The security and surveillance system of Claim 1,
further comprising:

a video camera for generating an image of said zone;
and

a television monitor coupled to said video camera,
said specific function controlling said television monitor
to display said image from said video camera.

Sub
a2

3. The security and surveillance system of Claim 2,
further comprising:

a plurality of detectors for determining a presence in
a plurality of surveillance zones, each detector monitoring
a separate surveillance zone;

a plurality of video cameras for generating images
from said plurality of surveillance zones, each video
camera associated to with a separate surveillance zone; and

a camera switcher for controlling said images to said
television monitor, said specific function controlling said
television monitor to display said images from said video
cameras.

~~2.~~
~~4.~~

The security and surveillance system of Claim 1,
wherein said processor includes a timer for controlling an
interval of said specific function.

5. The security and surveillance system of Claim 1, wherein said processor includes an infrared emitter for generating said infrared code corresponding to said activation signal.

5

6. The security and surveillance system of Claim 5, wherein said processor includes an infrared sensor for receiving said infrared code from said infrared emitter.

10 Sub
a3

7. The security and surveillance system of Claim 6, further comprising:

an infrared flasher for transmitting said infrared code to perform said specific function.

15

8. The security and surveillance system of Claim 1, wherein said processor is programmable to generate different infrared codes corresponding to different specific functions.

20

9. The security and surveillance system of Claim 8, wherein said specific function is to adjust lighting within said zone of surveillance.

12

Sub
a4

10. A device for monitoring a plurality of zones of surveillance, comprising:

a separate detector corresponding to each zone of surveillance for detecting an undesirable presence, each detector generating an activation signal in response to said undesirable presence;

a separate video camera corresponding to each zone of surveillance for generating images of each zone of surveillance;

a camera switcher for transmitting selected images from said plurality of video cameras;

a television monitor for displaying said selected images from said camera switcher;

a processor for generating an infrared coded signal in response to said activation signal in order to perform a specific function for controlling said television monitor.

^{13.}

¹²
~~11.~~ The device of Claim ~~10~~, wherein said processor is programmable to generate different infrared coded signals for performing different specific functions that control said television monitor such that said processor can interrupt normal viewing behavior or activate said television monitor for displaying an appropriate image of a triggered zone of surveillance.

^{14.}

¹²
~~12.~~ The device of Claim ~~10~~, further comprising:

a separate light assembly corresponding to each zone of surveillance, said processor controlling said light assembly to adjust an amount of light within a zone of surveillance.

^{15.}

¹²
~~13.~~ The device of Claim ~~10~~, wherein said specific function is to display selected images on a picture in picture window of said television monitor.

13

^{19.}
~~14.~~ The device of Claim ¹²~~10~~, further comprising:

a UHF modulator for converting said selected signals into a UHF signal, wherein said specific function is to display said selected images on a predetermined UHF channel of said television monitor.

^{20.}
~~15.~~ The device of Claim ¹⁹~~14~~, wherein said processor operates in a first, second, and third mode, said first mode disables said processor, said second mode interrupts television viewing upon detection of said undesirable presence, said third mode activates said television monitor during non-viewing periods to display said selected images upon detection of said undesirable presence.

16. A method of surveillance, comprising the steps of:

monitoring a zone of surveillance to detect an existence of an undesirable presence;

generating an infrared coded signal in response to said undesirable presence;

performing a specific function in response to said infrared coded signal.

17. The method of Claim 16, further comprising the step of:

generating a different infrared code to perform a different specific function as desired.

18. The method of Claim 16, further comprising the steps of:

generating an image of said zone of surveillance, wherein said specific function is to control a television monitor in order to display said image.

14

19. The method of Claim 18, wherein a plurality of zones of surveillance are monitored and a plurality of images are generated corresponding to each zone of surveillance, wherein said images are selected for display on said monitor.

5

20. The method of Claim 16, wherein said performing step occurs over a specific time interval.
